| An interface in Java is a blueprint of a class. It has static constants and abstract methods. **Next ** **Interface** **Example of Interface** |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The interface in Java is a mechanism to achieve abstraction. There can be only abstract methods in the Java interface, not method body. It is used to achieve abstraction and multiple inheritance in Java. Multiple inheritance by Interface Why multiple inheritance is supported in Interface while it is not supported in case of class. |
| In other words, you can say that interfaces can have abstract methods and variables. It cannot have a method body. Java Interface also represents the IS-A relationship. |
| It cannot be instantiated just like the abstract class. Since Java 8, we can have default and static methods in an interface. Since Java 9, we can have private methods in an interface. |
| Why use Java interface? There are mainly three reasons to use interface. They are given below. |
| By interface, we can support the functionality of multiple inheritance. It can be used to achieve loose coupling. |
| By interface, we can support the functionality |
| of multiple inheritance. It can be used to achieve loose coupling. |
| How to declare an interface? |
| An interface is declared by using the interface keyword. It provides total abstraction; means a the methods in an interface are declared with the empty body, and all the fields are publi static and final by default. A class that implements an interface must implement all the method declared in the interface. |
| interface <interface_name>{</interface_name> |
| // declare constant fields // declare methods that abstract // by default. } |
| Java 8 Interface Improvement Since Java 8, interface can have default and static methods which is discussed later. Internal addition by the compiler |
| The Java compiler adds public and abstract keywords before the interface method. Moreover, it adds public, static and final keywords before data members. |
| In other words, Interface fields are public, static and final by default, and the methods at public and abstract. interface Printable{ int MIN=5; void print(); interface Printable{ public static final int MIN=5; public abstract void print(); |
| Printable.java Printable.class The relationship between classes and interfaces |
| As shown in the figure given below, a class extends another class, an interface extends another interface, but a class implements an interface. |
| class interface interface extends |
| class class interface |
| Java Interface Example In this example, the Printable interface has only one method, and its implementation is provide in the A6 class. |
| <pre>interface printable{ void print(); } class A6 implements printable{</pre> |
| <pre>public void print(){System.out.println("Hello");} public static void main(String args[]){ A6 obj = new A6(); obj.print();</pre> |
| Obj.print(), } Test it Now |
| Output: Hello |
| Java Interface Example: Drawable In this example, the Drawable interface has only one method. Its implementation is provided to Rectangle and Circle classes. In a real scenario, an interface is defined by someone else, but it implementation is provided by different implementation providers. Moreover, it is used to someone else. The implementation part is hidden by the user who uses the interface. |
| File: TestInterface1.java //Interface declaration: by first user interface Drawable{ |
| <pre>void draw(); } //Implementation: by second user class Rectangle implements Drawable{ public void draw(){System.out.println("drawing rectangle");}</pre> |
| class Circle implements Drawable{ public void draw(){System.out.println("drawing circle");} } //Using interface: by third user |
| <pre>class TestInterface1{ public static void main(String args[]){ Drawable d=new Circle();//In real scenario, object is provided by method e.g. getDrawable() d.draw();</pre> |
| }} ✓ Test it Now Output: |
| Java Interface Example: Bank Let's see another example of java interface which provides the implementation of Bar |
| interface. File: TestInterface2.java interface Bank{ |
| <pre>float rateOfInterest(); } class SBI implements Bank{ public float rateOfInterest(){return 9.15f;} }</pre> |
| <pre>class PNB implements Bank{ public float rateOfInterest(){return 9.7f;} } class TestInterface2{</pre> |
| <pre>public static void main(String[] args){ Bank b=new SBI(); System.out.println("ROI: "+b.rateOfInterest()); }}</pre> |
| Output: ROI: 9.15 |
| Multiple inheritance in Java by interface If a class implements multiple interfaces, or an interface extends multiple interfaces, it is known |
| as multiple inheritance. |
| interface interface interface |
| interface interface interface |
| interface interface interface interface class interface Multiple Inheritance in Java interface Printable{ void print(); } |
| interface interface interface interface class interface Multiple Inheritance in Java interface Printable{ void print(); |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ public void print(){System.out.println("Hello");} public void show(){System.out.println("Welcome");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ public void print(){System.out.println("Hello");} public void show(){System.out.println("Welcome");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } C Test it Now Output: Hello Welcome |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ public void print(){System.out.println("Hello");} public void show(){System.out.println("Welcome");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } Test it Now Output: Hello |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable,Showable{ public void print(){System.out.println("Hello");} public void show(){System.out.println("Hello");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } IT Test it Now Output: Hello Welcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the case of class because of ambiguity. However, it is supported in case of an interface because there is no ambiguity. It is because its implementation is provided by the implementation class For example: interface Printable{ void print(); |
| interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ public void print(){System.out.println("Hello");} public void show(){System.out.println("Hello");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } **Test It Now** Output: Hello Welcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the case of class because of ambiguity. However, it is supported in case of an interface because there is no ambiguity. It is because its implementation is provided by the implementation class For example: interface Printable{ |
| interface interface interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable{ public void print()(System.out.println("Hello");} public void show()(System.out.println("Hello");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.show(); } } C Test It Now Output: Hello Welcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the case of class because of ambiguity. However, it is supported in case of an interface because there is no ambiguity. It is because its implementation is provided by the implementation class for example: interface Printable{ void print(); } interface Showable{ void print(); } interface Showable{ void print(); |
| interface interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable(void show(); } class A7 implements Printable, Showable{ public void print(){System.out.printin("Helio");} public static void show(){System.out.printin("Welcome");} public static void main(String args[]){ A7 obj = new A7(); obj.print(); obj.print(); obj.show(); } } Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the isase of class because of ambiguity. However, it is supported in case of class because of ambiguity. However, it is supported in case of one interface because there is no ambiguity. It is because its implementation is provided by the implementation class for example: interface Printable{ void print(); } class TestInterface3 implements Printable, Showable{ public void print()(System.out.printin("Helio"); public static void main(String args[)(TestInterface3 ob) = new TestInterface3(); obj.print(); } } **Test It Now** |
| interface interface interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable(public void print()(System.out.println("Hello");} public static void main(String args[)){ A7 ob] = new A7(); obj.pint(); obj.show(); } } Crest it Now Output: Hello Welcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the case of class because of ambiguity. However, it is supported in case of an interface because there is no ambiguity. It is because its implementation is provided by the implementation class For example: interface Printable{ void print(); } interface Showable{ void print(); } class Testinterface3 implements Printable, Showable{ public void print(); } class Testinterface3 obj = new Testinterface3(); obj.print(); } } Crest it Now Output: Hello |
| interface interface interface interface interface interface Multiple Inheritance in Java Multiple Inheritance in Java interface Printable(void print(); } interface Showable(void show(); } class A7 implements Printable, Showable(public void show()(System.out.printin("Nelcome");) public void show()(System.out.printin("Nelcome");) public void show()(System.out.printin("Nelcome");) } } Test it New Output: Hell to Melcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in tesse of class because of amiliguity. However, it is supported in case of an interface because three is no ambiguity. It is because its implementation is provided by the implementation class for example: interface Printable(void print(); } interface Showable(void print(); } interface Showable(void print()(System.out.printin("Nello");) public void print()(System.ou |
| interface interface interface interface interface interface Multiple Inheritance in Java interface Printable{ void print(); } interface Showable{ void show(); } class A7 implements Printable, Showable(public void print()(System out.printn("Hello");) public void show()(System.out.printn("Welcome");) public static void main(String args[]){ A7 obj = new A70; obj.print(); obj.print();) } C Test It Now Output:Helto Welcome Q) Multiple inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the save of class because of ambiguity. However, it is supported in case of an interface why? As we have explained in the inheritance chapter, multiple inheritance is not supported in there is no ambiguity. It is because its implementation is provided by the implementation class For example: interface Printable{ void print(); } interface3 limplements Printable, Showable{ public void print()(System.out.printn("Helio");) public static void main(String args[]){ Test it Now Output: Helto As you can see in the above example, Printable and Showable interface have same methods b its implementation is provided by class TestTnerface1, so there is no ambiguity. |
| interface interface interface interface interface interface wettends interface Multiple Inheritance in Java interface Printable{ void print(); } } interface Showable{ void show(); } class A? Implements Printable, Showable(public void print(); spublic void show(); (System.out.printin("Welcome");) public static void main(String args[]){ A7 ob) = new A7(); ooj.print(); ooj.print(); ooj.print(); ooj.print(); } } C **Test It New** Output: Hel to Melcome Output: Hel to Inheritance is not supported through class in java, but it is possible by an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in tase of class because of ambiguity. However, it is supported in case of an interface becauthere is no ambiguity. It is because its implementation is provided by the implementation class for example: interface Printable{ void print(); } class Testinterface3 implements Printable, Showable(public void print(); } class Testinterface3 implements Printable, Showable(public void print(); } Test It Now Output: Hell to As you can see in the above example, Printable and Showable interface have same methods b its implementation is provided by class TestTinterface1, so there is no ambiguity. Interface inheritance A class implements an interface, but one interface extends another interface. interface Printable(void print(); } Interface Printable(void print(); } Interface inheritance A class implements an interface, but one interface extends another interface. |
| interface interface interface interface interface Multiple Inheritance in Java interface Printable(void print();); interface Showable(void show();); class A7 Implements Printable, Showable(public void print()(System out.printin("Netion");) public static void main(String args[))(A7 col) = new A70; od),print(); od),print(); od),print(););) Test it Now Output: Hello Welcone Q) Multiple inheritance is not supported through class in java, but it is possibly an interface, why? As we have explained in the inheritance chapter, multiple inheritance is not supported in the see of class because of ambiguity, However, it is supported in case of a interface becauthere is no ambiguity, it is because its implementation is provided by the implementation clas for example: interface Printable(void print();) thereface Printable(void print();) class TestInterface3 implements Printable, Showable(public void print();) } class TestInterface3 ob j = new TestInterface30; ooj.print();) } Test its Now Output: Hello As you can see in the above example, Printable and Showable interface have same methods b its implementance is not supported and Showable interface have same methods b its implements in interface, but one interface extends another interface. A class implements an interface, but one interface extends another interface. interface Printable(void print();) Interface inheritance A class implements an interface, but one interface extends another interface. interface Printable(void print();) Interface inheritance A class implements an interface, but one interface extends another interface. interface Printable(void print();) Interface showable extends Printable(void show();) Interface displaced objenew testing(); Testinterfaced objenew testing(); |
