Method Overriding in Java

overriding in Java.

If subclass (child class) has the same method as Understanding the problem without method declared in the parent class, it is known as method overriding Can we override the static method In other words, If a subclass provides the specific Method overloading vs. method overriding

implementation of the method that has been declared by one of its parent class, it is known as method overriding. Usage of Java Method Overriding

Method overriding is used to provide the specific implementation of a method which is already provided by its superclass.

Method overriding is used for runtime polymorphism

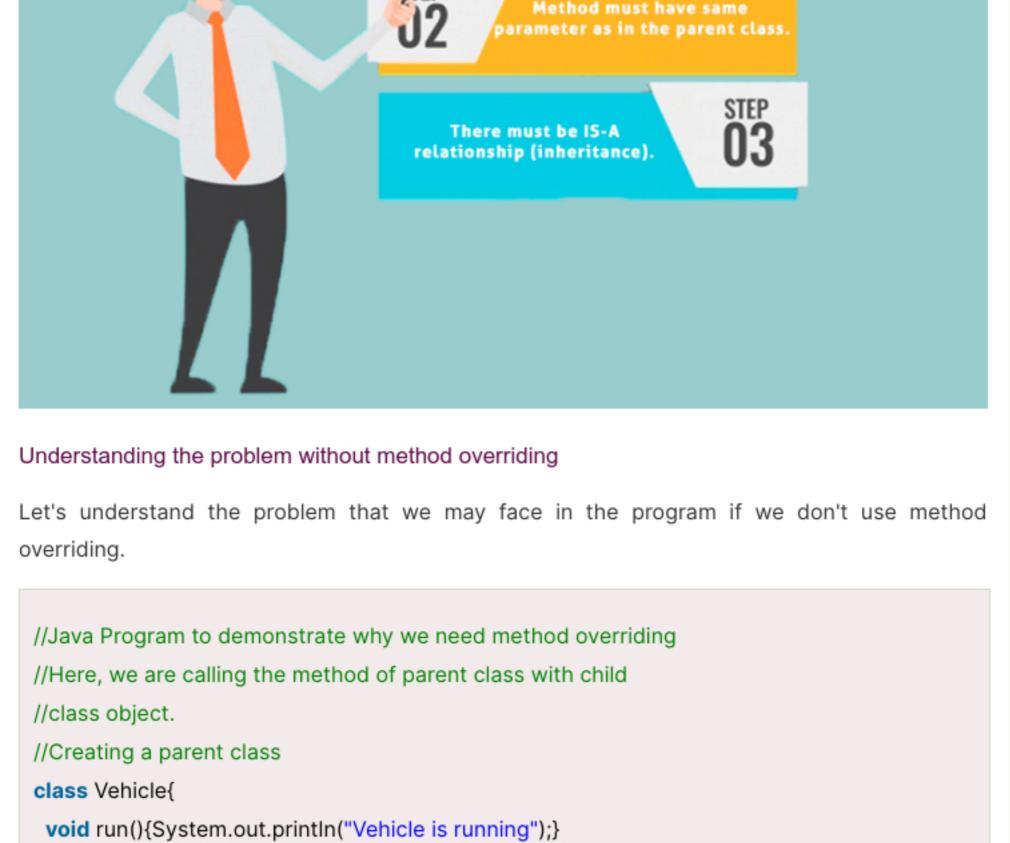

Rules for Java Method Overriding 1. The method must have the same name as in the parent class

Method must have same

Rules for Java Method Overriding

There must be an IS-A relationship (inheritance).

The method must have the same parameter as in the parent class.

class Bike extends Vehicle{ public static void main(String args[]){

//calling the method with child class instance

//creating an instance of child class

}

//Creating a child class

Bike obj = new Bike();

why we use method overriding.

Example of method overriding

obj.run();

Test it Now

Output: Vehicle is running

Problem is that I have to provide a specific implementation of run() method in subclass that is

In this example, we have defined the run method in the subclass as defined in the parent class

but it has some specific implementation. The name and parameter of the method are the same,

and there is IS-A relationship between the classes, so there is method overriding.

//Java Program to illustrate the use of Java Method Overriding

void run(){System.out.println("Vehicle is running");}

//defining the same method as in the parent class

obj.run();//calling method

Bike is running safely

Test it Now

Output:

Bike2 obj = **new** Bike2();//creating object

A real example of Java Method Overriding

class Bike2 extends Vehicle{

//Creating a parent class.

//defining a method

//Creating a child class

class Vehicle{

}

void run(){System.out.println("Bike is running safely");} public static void main(String args[]){

Consider a scenario where Bank is a class that provides functionality to get the rate of interest.

However, the rate of interest varies according to banks. For example, SBI, ICICI and AXIS banks

Bank

getRateOfInterest(): float

ICICI

Java method overriding is mostly used in Runtime Polymorphism which we will learn in next pages.

extends

AXIS

getRateOfInterest(): float

```
getRateOfInterest(): float
                                          getRateOfInterest(): float
```

SBI

//Creating a parent class.

int getRateOfInterest(){return 8;}

int getRateOfInterest(){return 7;}

class ICICI extends Bank{

}

}

}

Test it Now

Output:

could provide 8%, 7%, and 9% rate of interest.

class Bank{ int getRateOfInterest(){return 0;} } //Creating child classes. class SBI extends Bank{

//Java Program to demonstrate the real scenario of Java Method Overriding

//where three classes are overriding the method of a parent class.

```
}
class AXIS extends Bank{
int getRateOfInterest(){return 9;}
}
//Test class to create objects and call the methods
class Test2{
public static void main(String args[]){
SBI s=new SBI();
ICICI i=new ICICI();
AXIS a=new AXIS();
```

System.out.println("SBI Rate of Interest: "+s.getRateOfInterest());

System.out.println("ICICI Rate of Interest: "+i.getRateOfInterest());

System.out.println("AXIS Rate of Interest: "+a.getRateOfInterest());

ICICI Rate of Interest: 7 AXIS Rate of Interest: 9

SBI Rate of Interest: 8

Can we override static method? No, a static method cannot be overridden. It can be proved by runtime polymorphism, so we will learn it later.

object. Static belongs to the class area, and an instance belongs to the heap area. Can we override java main method?

It is because the static method is bound with class whereas instance method is bound with an

No, because the main is a static method.

Why can we not override static method?
